My panel got painted by my stepdaughter her husband in a professional paint booth.

Very glad how well its finished with the matt look.

I took of the top skin and installed the panel, hopefully for the last time.

Then started reinstalling all the components and cleaning up the wiring behind the panel.

Finally being able to use the final hardware and torque it to spec feels good. This shouldn't come apart again.

Took some shots with the power back on. The side panels still need to stay loose as I don't have the correct length hardware and it probably still needs to be removed when rivetting the top skin which is one of the very last tasks on the plane.

Wide view. The right side bracket is not yet installed as it's being repaired because of some lettering being diffused.
